

CIMA COMPUTER

**Versatile management and control programs to meet all needs,
with exportable reports prepared for interconnection.**

CIMA technicians with their experience and with the use of modern technologies have created computerized systems with infinite configuration possibilities, to best meet the operational and liquid feeding management phases in pig farming.

Simple and intuitive programs are the daily tool for the farmer, essential for precise technical, economic and managerial assessments, with reports on consumption, feed yields, weight gains and updated box situations.

These systems can be interfaced with the most common electronic devices (mobile phone, tablet) that allow the operator the ability **to manage the system remotely**.
